REDTAP / ADIE

SECURITY LAW BOOK (SLB) | FORMAL ARCHITECTURE REPRESENTATION

PATH 1 — PROPOSAL v1.0

PROPOSED • NOT APPROVED • NO IMPLEMENTATION AUTHORIZATION

REDTAP ECOSYSTEM

Core • NoredAm • platforms • devices

→ **ADIE GOVERNANCE**

Constitutional authority & supervision

→ **PATH 1 / SLB**

Normative rules • governed versions

→ **PATH 2 / DAD**

Derives effective authority

→ **PATH 3–4 / PA + IE**

Portable authority • local enforcement

→ **PATH 5–6 / EFFECT + AUDIT**

Verified effect • evidence • audit

CONSTITUTIONAL POSITION AND DOWNSTREAM CONSUMPTION (CONTEXT; NOT A PATH 1 IMPLEMENTATION)

SLB GOVERNANCE & CONTROL

- Rule authoring / ownership
- Authority source & provenance
- Structural + semantic validation
- Conflict / compatibility analysis
- Approval record & decision basis
- Version sealing / immutable history
- Publication / activation control
- Suspension / withdrawal / review
- Effective-time administration
- Amendment / supersession lineage

→

CANONICAL SLB LIBRARY / NORMATIVE SOURCE

- RULE: stable ID + immutable version
- Rule class / normative effect
- Source / owner / provenance
- Applicability / scope
- Constraint relationships
- Lifecycle / effective interval
- Approval / validation evidence
- POLICY → POLICY SET
- POLICY STATE / version references

→

ADIE SEMANTIC CONTRACT

- Applicable-rule determination
- Authority relationships
- Constraint composition
- Conflict handling / escalation
- No implicit permission
- No authority from engine/file order
- Deterministic normalized outcomes
- Explicit missing / stale / invalid

→

CONTROLLED EVALUATION ADAPTER

- Canonical source remains normative
- Controlled compile / transform profile
- Bind artifact to source versions
- Evaluator + adapter version/config
- Integrity / signature reference
- Raw + normalized result mapping
- Diagnostics / error semantics
- Semantic conformance evidence

→

CONSUMPTION & TRACEABILITY

- DAD: derives effective authority
- PA: carries bounded authority
- IE: enforces at each boundary
- Platforms: domain execution only
- Evidence cites rule / state versions
- Audit traces decision and execution
- No subsystem broadens rule meaning
- Decision ≠ verified effect

GOVERNANCE LIFECYCLE / STATE TRANSITIONS

AUTHOR → VALIDATE AUTHORITY / OWNERSHIP → VALIDATE STRUCTURE / SEMANTICS → CONFLICT ANALYSIS → APPROVE → VERSION / SEAL → PUBLISH → ACTIVATE → MONITOR / REVIEW

Amendment creates a new immutable version; suspension / withdrawal preserve history and references. *Approval ≠ publication ≠ activation.*

Governance event time ≠ effective time. *Compilation / loading ≠ activation or conformance approval.*

NORMALIZED ADIE EVALUATION OUTCOMES

PERMIT	DENY	NOT_APPLICABLE	INDETERMINATE	INVALID_POLICY_SET	STALE_POLICY_STATE
Decision supports authority	Authorization prohibited	No applicable rule; not permit	Cannot establish result	Cannot activate	Required state unavailable

DISTINCT STATE DOMAINS

Authority state: VALID • REVOKED • EXPIRED • SUSPENDED • OUT_OF_SCOPE • INDETERMINATE

Task state • operation state • verified-effect result remain separate vocabularies; evaluation outcome is not authority state.

PATH 1 BOUNDARY

Logical architecture only. Physical schema, APIs, production engine selection, implementation and Paths 2–6 remain separately gated.

Core retains identity/authentication/tenant/role/permission ownership. NoredAm retains engineering/DevTools. ADIE governs security semantics.
